65,536 WORD x 1 BIT CMOS STATIC RAM

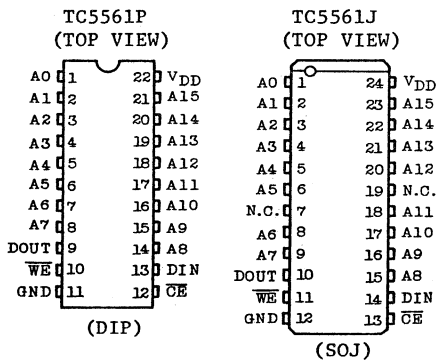

DESCRIPTION

The TC5561P/J is a 65,536 bit high speed static random access memory organized as 65,536 words by 1 bit using CMOS technology, and operated from a single 5-volt supply. Toshiba's high performance device technology provides both high speed and low power features with a maximum access time of 45ns/55ns/70ns and maximum operating current of 100mA at minimum cycle time. The TC5561P/J also features an automatic stand-by mode. When deselected by Chip Enable (\overline{CE}), the operating current is reduced from 100mA to 2mA. The TC5561P/J is suitable for use in main memory of high speed computer and pattern memory, where high speed/low power/high density are required. The TC5561P is moulded in a 22 pin plastic DIP with 300 mil width for high density assembly and the TC5561J is moulded in a 24 pin plastic SOJ with 300 mil width for high density surface assembly. The TC5561P/J is fabricated with ion implanted CMOS silicon gate MOS technology for high performance and high reliability.

INTRODUCTION

We continually venture at the leading edge of technology so that we may develop and offer to you a diverse array of semiconductor memory products which may be used in many commercial and industrial applications. At this time, we offer three data books; "MOS-Memory Dynamic RAM and Module", "MOS-Memory Video RAM and Static RAM" and "MOS-Memory ROM".

Particularly, this data book is "MOS-Memory Video RAM and Static RAM" edition.

These data books represent our current culminations of electrical characteristics, timing waveforms and package data for our line of semiconductor memory products.

We hope this information will be very useful for you.
